Dear patients,

as the Department of Coloproctology, we are the first center in Brandenburg that specializes in the treatment of diseases of the small intestines, the colon, the rectum, as well as diseases of the anus and pelvic floor.

A major focus of our clinic is the treatment of colorectal carcinomas. In 2009 we were certified as Colorectal Cancer Center by the German Cancer Society and remain the only center to have been awarded this qualification in Potsdam and its surroundings. Our aim is to provide an excellent therapy in accordance with standard international guidelines. In order to do so, interdisciplinary and quality-assured cooperation of specialists from different departments is required. The quality of our work is regularly reviewed by OnkoZert according to the guidelines of the German Cancer Society.

When a surgical treatment of colorectal carcinoma is indicated, we specialize in using gentle surgical techniques. Most interventions on the colon and rectum are performed using minimally invasive technology. Large adenomas (benign tumors) as well as early stages of rectal cancer can frequently be removed using the "TEM" technique through the anus without visible scars. In the case of tumors with close proximity to the sphincter, we can avoid a permanent artificial bowel outlet (ostomy) in most cases by using the latest surgical techniques.

The second major focus of our clinic are proctological diseases: diseases that affect the rectal and anal region. Many patients fear presenting themselves to a doctor suffering from symptoms in this area. Yet most proctological diseases are harmless and can often be treated conservatively or with small surgical measures. The remaining few serious illnesses should always be treated by proctology specialists. Usually a simple proctological examination will suffice for diagnosis and determination of necessary measures. In the few cases requiring further examination, we offer a wide range of diagnostics directly in our clinic.

Best regards
Dr. Zülküf Tekin

Services

In our clinic, the entire spectrum of conservative and surgical treatment is offered for colorectal diseases.

This includes, for example, the therapy of the following diseases:

Diseases of the colon:

- colon cancer
- colonic polyps / adenomas
